This year marks the 10th anniversary of the publication of the “World Catalogue of Insects, Volume 5: Lepidoptera (Tortricidae).” Compiled by John Brown with assistance from Joaquin Baixeras, Richard Brown, Marianne Horak, Furumi Komai, Eric Metzler, Jozef Razowski, and Kevin Tuck, this publication was the first attempt at cataloguing the complete world tortricid fauna. The original hard-copy version of the catalogue contained approximately 9,000 species. The current “Online World Catalogue of the Tortricidae,” hosted by Todd Gilligan on Tortricid.net, contains more than 15,000 records representing 10,883 species. It is updated on a regular basis, is fully searchable, and contains photographs of more than 1,200 type specimens. The catalogue was recently updated (December 2014) to Version 3.0.

Background

Shortly before the original hard-copy catalogue was to be released, John Brown, Ximo Baixeras, and Todd Gilligan discussed a plan for placing this information on the web in some type of online database that would receive regular updates. The publisher, Apollo Books, agreed that the information could be released to the web after the book had been for sale for two years, so arrangements were made to import the data from the paper catalogue, which existed only as a static WordPerfect document, into a database. Ximo spearheaded the import efforts using scripts and much manual editing, and had a rudimentary FileMaker database ready for testing by mid-2007 (almost exactly two years after the catalogue was published). Todd created web pages to display and search the information on Tortricid.net, and the first online version of the tortricid catalogue went live 5 October 2007.

Updates

It has been more than seven years since the release of the first online version of the tortricid world catalogue. One of the original motivations for placing this information online was to enable the tortricid community to contribute to the catalogue by providing corrections and updates. This plan worked better than was ever imagined. By the time the online database was complete in 2007, John’s original copy of the paper catalogue (with its binding nearly gone) had a couple hundred scribbled corrections and additions; the latest version of the online catalogue has more than 3,000 corrections and additions to the original version. The person responsible for the most corrections to the catalogue is Kevin Tuck, (former) curator at the Natural History Museum in London, who regularly used and checked the online database as he curated the NHM’s tortricid collection. The person responsible for the most additions to the catalogue is Jozef Razowski, whose tireless work on the alpha taxonomy of tortricids has provided us with more than...
2,700 names (easily surpassing Meyrick as the single most prolific author in the family). The online catalogue has gone through three major revisions, with John and Todd attempting to implement minor updates on an annual basis and major updates every two years.

Current Version

The current version of the Online World Catalogue of the Tortricidae is Version 3.0, released in December 2014. It contains more than 1,600 updates from the previous version (2012) and is current through early 2014. The species database contains 15,099 records, with 10,833 of these senior species names; the generic database contains 1,742 records, with 1,111 of these senior generic names. The suprageneric classification has been updated to match that of Regier et al. (2012).

The database, which is now hosted via Microsoft SQL Server, is fully searchable, with search fields for genus, species, author, type locality, and museum. The database can also provide a list of genera by tribe or subfamily. All search fields accept wildcards or partial text matches, so exact spelling is not required. You can access the online world catalogue from the “Tortricid.net” site or at http://www.tortricid.net/catalogue.asp.

Todd M. Gilligan

UPCOMING MEETINGS

Annual meeting of the Lepidopterists’ Society, 28 July through 2 August 2015, Purdue University, West Lafayette, Indiana, USA.

XIXth European Congress of Lepidopteryology, 27 September through 2 October 2015, Radebeul, Germany.

Entomological Society of America, 15-18 November, 2015, Minneapolis, Minnesota, USA.

TORTRICIDAE OF TAIWAN

Yinghui Sun, a PhD student in the laboratory of Dr. Houhun Li, Nankai University, Tianjin, P. R. China, spent much of last year (September 2013 to September 2014) studying in the U.S., working on the Tortricidae of Taiwan. She split her time between the McGuire Center for Lepidoptera Research and Insect Conservation at the University of Florida, Gainesville, and the National Museum of Natural History, Smithsonian Institution, Washington, DC. Her database includes over 4,000 specimen records. If you are interested in the tortricid fauna of Taiwan, e-mail Yinghui at “sunyinghui8789@126.com.”
NEW TORTRICID TAXA DESCRIBED IN 2013

Below is a list of the tortricid taxa described in 2013; it is followed by a list of new synonyms, new combinations, and revised combinations, followed by the literature that supports the proposed additions and changes. Because the new taxa and taxonomic changes have been incorporated into the on-line tortricid catalogue, I would appreciate it if authors of new taxa would take a moment to review their citations and spellings and provide me (and/or Todd Gilligan) with any necessary corrections. Thanks much.

LITERATURE IN SUPPORT OF TAXONOMIC CHANGES

Wright, D. 2013. Two new species of Phaneta (Tortricidae) from southern California, with reviews of ten similar species. Journal of the Lepidopterists’ Society 67: 175–186.

Yu, H., Li, B. 2013. First record of the genus Megalota Diakonoff from China, with the descriptions of two new species.
(Lepidoptera: Tortricidae: Olethreutinae).
Zootaxa 3641: 476–480.

Sparganocosma docsturnerorum Brown, 2013,
a new genus and species from Costa Rica.

 TRACKING OUR TAXONOMIC PROGRESS, 2005–2013

The following table provides a brief assessment of the number of new species and genera described in Tortricidae since 2005. Since 2004, our community has described an average of 195 species and 12 genera per year. Of course, the vast majority of new taxa continue to be described by Jozef Razowski and co-authors, accounting for over 75% of the species in 2013.

In regards to geographic trends, descriptions of new taxa from the Neotropical Region were back in the lead (ca. 36% of the new taxa), but with many new species from Indonesia (28%), New Caledonia (12%), and China (7%).
